

TREATMENT FOR EBOLA

There's currently no treatment for Ebola virus disease, despite drug therapies

Dehydration is common, so fluids may be given directly into a vein. Blood oxygen levels and blood pressure also needs to be maintained at the right level,

Ebola virus disease is often fatal, with 1 in 2 people dying from the disease. The sooner a person is given care, the better the chance they'll survive.

After a person recovers from Ebola, their semen or breast milk may continue to carry the virus for anywhere between several weeks to several months.
